After power on, connect the console power supply. When receiving the DMX512 console signal, the address d--- becomes A---, and it is controlled by the console signal.

In the address code 001 state, after multiple machines are connected, if there is no console, the master-slave connection function can be realized. Operate one of the devices, and the other devices in the address 001 state follow the host to run the program synchronously. The DMX512 signal must be cut off when the master-slave connection is in progress.
